

RTK-GPS Plough Control

- Straight furrows, even in the dark
- Works on every vari-plough
- Works also with curved pattern
- Problem free ploughing of wedges
- Easily adjust the number of furrows
- Quickly adjust the plough width
- Works with existing Autopilot valve

Agrometius, the Dutch distributor of Trimble AgGPS™ products has developed a system to control vari-ploughs with RTK-GPS. The **GeoPlough 100 system** adjusts the plough width hydraulically according to the offline distance. This way a curved furrow can easily be made straight. Geoplough 100 is an "add on" for tractors which are equipped with the Trimble Autopilot system.

GeoPlough 100 works on every vari-plough, no matter which brand or number of furrows. You can easily set the desired plough width and the number of furrows in the controller. With this system everybody can now plough straight! Even in foggy weather and at night!
